

CIVICORBIT GAMIFYING CIVIC PARTICIPATION THROUGH ON- DEVICE AI VERIFICATION

From CivicMitra to CivicOrbit — A Cross-Platform Mobile App for Verifiable Civic Engagement

TEAM MEMBERS

Omkar Kahandal (36)
Sanchita Misar (46)
Abhijith Nair (47)
Harsh Navandar (49)

An illustration of a person with dark hair, wearing a purple long-sleeved shirt and orange pants, sitting on a light orange bench and reading a white book. The background features a stylized cityscape with green hills, a tall purple lamppost, and a large orange rounded rectangle containing white text. In the top left corner, there are icons for a house with Wi-Fi, a key, a speech bubble, a padlock, and a lightbulb.

MOTIVATION

- India has one of the world's largest bases of civically active citizens — voting, filing complaints, signing petitions, volunteering, donating
- Yet this participation remains invisible: no system captures, verifies, or values it
- Civic engagement is largely intrinsically motivated and hard to sustain — no feedback loop, no recognition, no continuity
- Gamification has proven success in fitness (Strava), learning (Duolingo), and finance (credit scores) — civic life has no equivalent
- An opportunity exists to apply on-device AI + gamification responsibly to make civic participation visible, trackable, and rewarding

A stylized illustration of a person with dark hair, wearing a dark blue long-sleeved shirt and orange pants, sitting on a light orange bench. They are holding an open book and looking at it. To their right is a tall, dark blue lamppost with a white spherical light fixture. The background features a green lawn, a city skyline with various buildings in shades of blue, orange, and grey, and rolling hills under a pale yellow sky. The overall style is flat and modern.

PROBLEM DESCRIPTION

- No unified system exists to recognize or measure everyday civic actions across platforms (voting, municipal complaints, petitions, volunteering, donations)
- Genuine engagement is under-incentivized, leading to inconsistent participation over time
- Manual self-reporting is unreliable — no verification, prone to false claims
- Existing civic-tech apps focus on single actions (e.g., only complaints) — none unify multiple civic behaviors into one rewarding ecosystem
- Core problem: absence of a trustworthy, privacy-respecting, AI-verified system that converts real-world civic action into measurable, shareable recognition

PROJECT IDEA

- A mobile app that turns everyday civic actions into verifiable "Civic Points" using on-device AI
- Users submit proof (screenshots/receipts) of actions like voting, complaints, petitions, volunteering, donations
- On-device OCR + optional cloud verification confirms authenticity and prevents duplication/fraud
- Points drive a solar-system-themed progression (Mercury → Pluto) with badges, streaks, and real-time leaderboards
- Achievements are shareable on WhatsApp/Instagram, encouraging visibility and social motivation

SDG 11

- Sustainable Cities and Communities (civic participation, local governance engagement)

SDG 12

- Responsible Consumption and Production (digital-first verification reduces paper trails/manual record-keeping; encourages mindful, accountable civic resource use)

SDG 16

- Peace, Justice and Strong Institutions (transparency, accountability, citizen-institution trust)

SDG 17

- Partnerships for the Goals (connecting citizens, NGOs, and civic organizations)

PROTOTYPE BLOCK DIAGRAM AND GUI

PROTOTYPE VALIDATION / TESTING PLAN

Testing Levels:

- Unit Testing - OCR extraction accuracy, point-calculation logic, duplicate-detection functions (perceptual hashing, text similarity)
- Integration Testing - On-device pre-filter → cloud verification → points allocation → leaderboard update pipeline
- System Testing - End-to-end flow: screenshot capture → verification → badge/level update → shareable card generation

Validation Approach:

- Controlled dataset of sample screenshots (genuine, duplicate, edited/fraudulent) to benchmark OCR + fraud-detection accuracy
- User Acceptance Testing (UAT) with a small pilot group submitting real civic-action proofs
- Trust-tier validation — confirm Low/Medium/High verification tiers correctly classify evidence quality
- Load/stress testing on real-time leaderboard updates (Firestore/WebSocket) under concurrent users

VALUE PROPOSITION & BUSINESS FIT

Value Proposition:

- Turns invisible civic effort into visible, verifiable, rewarding activity — closing the recognition gap
- Combines on-device AI + gamification responsibly, ensuring privacy while still enabling trust
- Single unified platform for multiple civic actions (voting, complaints, petitions, volunteering, donations) — unlike existing single-purpose civic-tech apps
- Social virality built in via shareable achievement cards (WhatsApp/Instagram), driving organic user growth
- Strengthens citizen-institution trust by making participation measurable and transparent

Business Fit:

- B2C growth engine: freemium app model — free core features, potential premium tiers (advanced stats, exclusive badges)
- B2B/B2G partnerships: municipal bodies, NGOs, and CSR-driven organizations can sponsor city/org-scoped leaderboards and campaigns
- Data-driven insights (aggregated, privacy-compliant) valuable to policymakers and civic organizations for engagement trends
- Scalable across Indian cities/states, and adaptable internationally with localization
- Aligns with growing GovTech and CivicTech investment interest in India

THANK YOU SO MUCH!

Designing the Future of Urban Living
