

- # Group formation, topic brainstorming, initial idea drafting.
The project group was formed at the end of the semester, bringing together members with complementary interests in mobile applications development, AI, civic technology. During brainstorming, we discussed gap between everyday civic participation - voting, volunteering, donating - and lack of any system that recognises or rewards this behaviour.
This lead of initial idea: a mobile app that could detect genuine civic activity from users device and convert it into points, encouraging citizens to participate more consistently in civic life.
- # Finalize topic, project title, start background study.
The topic was finalized: as CivicOrbit: An AI-powered Gamified Platform for Civic Engagement Tracking.
A background study was conducted to understand existing research on gamification for civic participation, sustainable consumption, and digital governance. Studies show that gamification increases user engagement and game elements such as points, badges, levels have been used effectively in smart-city and civic contexts.
- # Prepare problem statement and requirement specification.
 - Problem Statement.
Civic participation in India is often invisible. There is no unified platform that recognises or measures multiple civic actions. CivicOrbit addresses this gap and converts

everyday civic actions into Civic Points. using On-device AI pipelines.

- Purpose and Scope

This SRS describes the functional and non-functional requirements for CivicOrbit. System allows user to submit proof of civic actions ; performs on device pre-filtering and OCR followed by optional cloud verification, de-duplication and point allocation.
